VC Funding Worldwide 2005-2015

Web Application Data Visualization Dashboard

Deployed App: https://frozen-dawn-61622.herokuapp.com/

By: Patrick Gendotti, Kanishka Ramanan

Project Motivation - Why?

- What are some major startup hubs around the world - they may be an indicator of tech hubs?
- Is there a large international presence of startup funding?
- Are there factors that contribute to a startup being successful vs. failing that can be determined from this dataset?
- What are the top 10 cities in the world by number of startups? By average startup funding? By total startup funding?
- What percentage of startups are found where in the world - is it evenly distributed, or are there highly concentrated areas with many startups (like Silicon Valley)?

Project Overview & Methodology

- Data sourced from Kaggle, Crunchbase, and Google Maps Geocoding API
- Cleaned by removal of
- Data loaded into PostgreSQL using SQLAlchemy and pandas
- Visualizations served as a Flask app
  - Two geographic map visualizations that use Mapbox with the Leaflet framework
  - Four bar chart funding visualizations that uses Chart.js - a JS library from outside this class
- Two RESTful APIs serving the visualizations in this app
  - ./samples.json to provide snapshot of entire, aggregated records of database to geographic visualizations
  - ./api/city/<country_code>/<city-name> to provide single-city data for bar chart funding visualizations
- Project served publicly using Heroku at https://frozen-dawn-61622.herokuapp.com/

Single-Page, Full-Stack App

- Single-page web application design gives users a GUI for accessing the data
- Deployment on Heroku enables access anywhere with an internet connection, on all devices - including smartphones and tables
- Simple, intuitive user controls for viewing data visualizations
- Popular, small-footprint JavaScript frameworks used for creating the data visualizations quickly and effectively
- Dynamic links from the Flask app to Heroku-hosted Postgres database enables dynamic updates upon database changes through RESTful APIs

Cluster Map Visualization

- Four different “layers” of markers showing different data
  - Startup count by city
  - Total funding amount by city (all startups within city)
  - Average funding amount by city
  - Percentage of number of startups in one city vs. total amount of startups worldwide in dataset
- Different marker styles and legends for each layer to make the map easier to understand
- Cluster map enables high levels of detail when zoomed in, and combined, generalized information when zoomed out
- Can look for overall trends as well as examine some smaller geographical areas for specific information about startups

Country Choropleth Visualization

- Three different “layers” of information available on this map
  - Number of startups per country (US dominant, so needed additional layer to show second-tier countries for startups)
  - Number of startups per country excluding the US
  - Average funding for startups in each country
- Enables viewing relative count of startups by country/continent
- Clear US dominance in startup count, which when multiplied by avg. startup value, results in highest influx of VC funding (according to Crunchbase sources)
- Promotes understanding of different average funding levels for startups by country, broken into three categories - high funding, some funding, and no funding

VC Funding Bar Charts

- Has a hard-coded array of the Top Cities; then fetches the data through our API
- Due to America's dominance in the Dataset, the charts are split into Top 5 American Cities and Top 5 Cities Excluding America
- Visually Distinguishes Funding by Equity and Debt
- Total Funding
    - Breaks up Fundings by Type and Round
- Average Funding Per Company
    - Splits funding from Equity and Debt

Used Charts.js to create

- Avg Funding
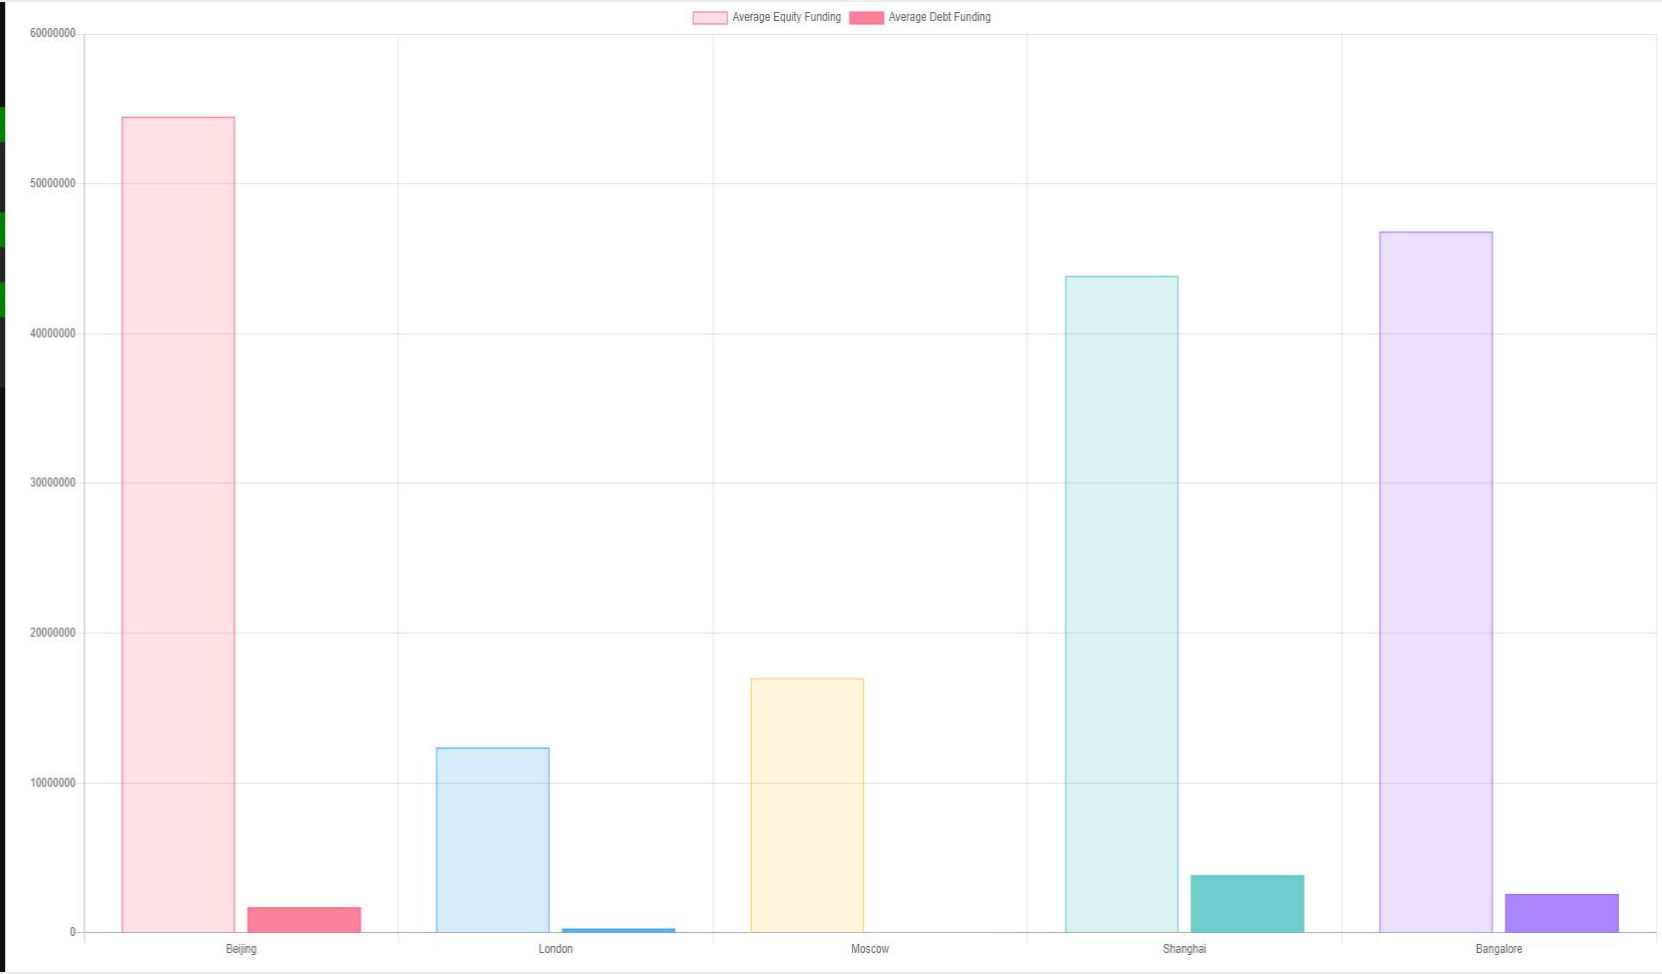
  - Top 5- US
  - Top 5- Not US



Caveats about Dataset

- Data has some issues with accuracy
  - Had an entry for the city “Albert, Germany” but the company website showed a company in Great Prairie, Alberta, Canada
- Data is older, and may be out of date with current trends
  - Only startups that received funding between 2005 and 2015 are shown - a good next step in this project would show similar visualizations with date filters
- Data may be incomplete
  - The funding was in USD, and most of the startups were headquarted in the US, Great Britain, and Canada
  - There may be foreign startups or funding sources that are not reported or known to Crunchbase, especially in countries with web censorship and vague accounting rules like China and Russia
